                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mycobacterium tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The antibiotic resistance spectrum (ARS) of a mycobacterium can be determined by amplifying the relevant part of the antibiotic resistance gene, i.e. the M. tuberculosis rpoB gene fragment amplified using the primer set ART12091-98, hybridising it with a least 1 rpoB gene probe, detecting the hybrids formed and inferring the ARS, and opt. the spp., from the differential hybridisation patterns. The method is partic. useful for the detection of rifampicin and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn.

                                                                                                                                       The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene sequencing primer rpoB-5s (bp 2201-2220). It is used with the reverse primer given in AAA49826 and with the amplification primers given in AAA49823 and AAA49824 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and
analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 16S/rrs (streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rposh, katc, rpsL/sl2 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as the contract of the presence of antibiotic resistance-inducing mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (VISI-) VISIBLE GENETICS INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11-DEC-1998;

This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S TRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katc, rpsL/sl2 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAX27214 standard; DNA; 306 BP

The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16s rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.

In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mycobacterial drug-resistance detection probe, a contrast group probe corresponding to each drug resistance detection probe, a contrast group probe detecting a hybridisation of the oligonucleotide chip and a marker for detecting a hybridisation of the oligonucleotide chip and a specimen. The identification probe is comprised of specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kit for mycobacterial species identification and detection, has oligonucleotide chip with species a mycobacterial drug-resistance detection probe,

The invention relates to a diagnostic kit for mycobacterial species identification and drug resistance detection comprising an oligonucleotide chip including a species identification probe, a mycobacterial drug-resistance detection probe, a contrast group prob corresponding to each drug resistance detection probe, and a marker detecting a hybridisation of the oligonucleotide chip and a specimen

a specimen. The sequences of

probe

The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the
                                                                                               Disclosure;

                 identification and drug resistance detection comprising an oligonucleotide chip including a species identification probe, a mycobacterial drug-resistance detection probe, a contrast group probe corresponding to each drug resistance detection probe, and a marker for detecting a hybridisation of the oligonucleotide chip and a specimen. The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS9978-AAS99569
    represent mycobacterium
                                                                                                                                                                                                                                                                                                           The invention relates to a diagnostic kit for mycobacterial
                                                                                                                                                                                                                                                                                                                                                               Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the patient.

                      PCR amplification was used to obtain rpoB genes from rifampicin-resistant Mycobacterium leprae strains. A comparison with the sequence of the rpoB gene from sensitive strains (AAQ51532) revermutations in the region encoding amino acids 400-450. The correspregion was isolated from M.tuberculosis (AAQ61457). A common mutation seen in resistant strains occurs at codon 425 where Ser

                                                                                                                 The present sequence is that of the Mycobacterium tuberculosis crops (rifampin resistance) gene (bp2161-2640). Amplification and cycle sequencing primers (see AAA48823-62) are used for the detection and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 165/rrs (streptomycin), embB (ethambutch), pncA (pyrazhamide), syrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is
                                                                                          performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genoty tests are rapid, sensitive and accurate providing information

                                                                                                                                                      04-SEP-2001
                                                                                                                                                                                                  AAH51976 standard; DNA; 3519 BP
                                                                                                                                                                                                                                                                                                                                                                                       to bacterial rpoB DNA. The method provides for the detection of M tuberculosis and the concurrent determination of its drug susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                    This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise a nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M.

                                                                                                                                          This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polynucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of an organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                12-NOV-1999;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 41,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 6
US-09-147-935A-50
Sequence 50, Application US/09147935A
Patent No. 6242584
GENERAL INFORMATION:
APPLICANT: KOOK, YOOH-HOH
TITLE OF INVENTION: A METHOD FOR IDENTIFYING MYCOBACTERIAL SPECIES BY
TITLE OF INVENTION: COMPARATIVE SEQUENCE ANALYSIS OF FOOB GENE
TITLE REFERENCE: 0136/0F425
CURRENT APPLICATION NUMBER: US/09/147,935A
CURRENT APPLICATION NUMBER: PCT/KR98/00228
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Sequence 10, Application US/09147935A

Patent No. 6242584

GENERAL INFORMATION:
APPLICANT: KICH, BUM-JOON
TITLE OF INVENTION: COMPARATIVE SEQUENCE ANALYSIS OF TPOB GENE
TITLE OF INVENTION: O. COMPARATIVE SEQUENCE ANALYSIS OF TPOB GENE
TITLE OF INVENTION: U.36/06425
CURRENT FILING DATE: 1999-03-19
PRIOR APPLICATION NUMBER: US/09/147,935A
CURRENT FILING DATE: 1999-03-19
PRIOR FILING DATE: 1998-07-28
NUMBER OF SEQ ID NOS: 50
SEQ ID NO 10
LENGTH: 306
                            APPLICANT: KIM, Bun-Joon
TITLE OF INVENTION: A METHOD FOR IDENTIFYING MYCOBACTERIAL SPECIES BY

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence 59, Sequence 59, Sequence 1, A Sequence 1, A Sequence 30, Sequence 6, A Sequence 9, A Sequence 10, Sequence 23, Sequence 23, Sequence 31, S

Sequence 10, Application US/09147935A

Patent No. 6242584

GENERAL INFORMATION:

APPLICANT: KOOK, YOON-HOH

APPLICANT: KOOK, YOON-HOH

TITLE OF INVENTION: COMPARATIVE SEQUENCE ANALYSIS OF FDOB GENE

TITLE OF INVENTION: COMPARATIVE SEQUENCE ANALYSIS OF FDOB GENE

FILE REFERENCE: 0136/0F425

CURRENT FILING DATE: 1999-03-19

PRIOR FILING DATE: 1998-07-28

NUMBER OF SEQ ID NOS: 50

SOFTWARE: KOPATIN 1.0

LENGTH: 306
              APPLICANT: KIM, Bum-Joon
TITLE OF INVENTION: A METHOD FOR IDENTIFYING MYCOBACTERIAL SPECIES BY
TITLE OF INVENTION: COMPARATIVE SEQUENCE ANALYSIS OF 100B GENE
FILE REFERENCE: 0136/0F425
CURRENT APPLICATION NUMBER: 0.5/09/147,935A
CURRENT FILING DATE: 1999-03-19
PRIOR APPLICATION NUMBER: PCT/KR96/00228
PRIOR FILING DATE: 1998-07-28
NUMBER OF SEQ ID NOS: 50
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence 7, sequence 50, sequence 50, sequence 59, sequence 11, Sequence 11, Sequence 44, sequence 9, sequence 13, sequence 23, sequence 23, sequence 31, sequenc
